Alerting Abstract US A1

NOVELTY - The method involves fetching multiple data frames into available space of a cache, and assigning a level to each of the multiple data frames by applying a recurring level pattern. A level cut-off is selected for multiple data frames in the space of the cache. The cache is fetched from any successive image frames with a level that is above the level cut-off of the multiple data frames.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

1.a data processing system comprising an assignment module

2.a program product comprising a set of instructions to select a level cut-off for multiple data frames.

USE - Used for processing data frame of a data processing system.

ADVANTAGE - The method processes the data frame of the data processing system to effectively render the image frames for display in succession at the desired rate.

DESCRIPTION OF DRAWINGS - The drawing shows a flow chart for a method of processing a data frame of a data processing system.

Alerting Abstract US B1

NOVELTY - A specified number of movies is delivered to the customer based on the order list included movie rental queue received from the customer on internet. An additional movie is selected and delivered to the customer based on several delivery criteria and order list, and the movie rental queue is updated.

DESCRIPTION - An **INDEPENDENT CLAIM** is also included for movies renting computer system.

USE - For renting commercial goods e.g. video, movies, games and music to customers physically and on internet.

ADVANTAGE - Enables to separate the decision of what items to rent from the decision of when to rent the items. Enables customer to specific what items to run using a item selection criteria and receive the items at a future point in a time without having to go to the provider to pick-up the

items. Customers are not constraint by conventional due dates and instead, are allowed to establish continuous, serialized rental streams of items. Allows more efficient inventory management.

DESCRIPTION OF DRAWINGS - The figure shows a flowchart explaining the on-line audio/video renting method.

Alerting Abstract US A1

NOVELTY - A querying logic is configured with messaging configuration information for selecting data from a database. A messaging logic such as electronic-mail (e-mail) system, wireless paging system stores e-mail configuration information for automatically sending selected data to an address entry of an address list.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

1.method for automatically transmitting data; and

2.computer readable medium storing program for automatically sending messages with selected data.

USE - For sending electronic mail (e-mail), pages to group of people of user terminal e.g. personal computer (PC), pagers, personal digital assistant (PDA), cell phone, with specific information from database e.g. open database connectivity (ODBC) compliant data source having standard database management system (DBMS) e.g. structured query language (SQL) server, **Oracle **, **Informix **, database-2 (DB2), **Sybase **, access database, excel spreadsheets.

ADVANTAGE - Efficiently sends electronic mail with specific information from database to selected list of people.

DESCRIPTION OF DRAWINGS - The figure shows a block diagram of the automatic messaging system.

Title Terms/Index Terms/Additional Words: AUTOMATIC; MESSAGING; SYSTEM; SEND; MAIL; SPECIFIC; INFORMATION; GROUP; PEOPLE; PERSON; COMPUTER; STORAGE; CONFIGURATION; DATA; SELECT; DATABASE; ADDRESS; ENTER; LIST

Alerting Abstract US A1

NOVELTY - The method involves identifying an item e.g. movie, with ratings similar to a particular item. A user is identified from a set of users that have given ratings to a subset of the item. The ratings are statistically similar to rating given by a particular user to the subset of item. An estimation of how the particular user would rate the particular item, is generated based upon ratings for the particular item.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.a machine-readable medium for estimating how a particular user would rate a particular item from a set of items
- 2.an apparatus for estimating how a particular user would rate a particular item from a set of items.

USE - Used for estimating user rating of an item e.g. movie, music and game stored on magnetic medium, optical medium, read-only memory and non-volatile memory e.g. tape.

ADVANTAGE - The method rents the item to a customer on a continuous basis that avoids use of fixed due date or rental window appurtenant. The method rents the movie, the game and the music to a consumer that is more convenient and flexible to the customer. The method estimates how a user would rate the item that the user has not yet rated.

DESCRIPTION OF DRAWINGS - The drawing shows a block diagram that depicts a users' rating of an item.

Alerting Abstract US A1

NOVELTY - The method involves sending a set of DVDs from a distribution location to a designated distribution location. Another set of DVDs located at another distribution location is identified. One set carries a set of movies that is not requested for rent by customers (502) associated with one distribution location. The former set of DVDs is sent from the former location to the designated location.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

1.a machine-readable medium having instructions which, when executed by processors, cause the processors to perform a method of managing rental items in distribution locations

2.a system for managing rental items in distribution locations.

USE - Used for managing a rental item e.g. optical media such digital versatile disc (DVD), compact disc (CD), CD-ROM, semiconductor-based storage device and read-only memory, having movies, music games and computer software, in a distribution location e.g. video rental store, distribution center, warehouse and hub, over a network e.g. local area network (LAN), wide area network (WAN) and Internet.

ADVANTAGE - The method effectively rents the items to the customers on a continuous basis to avoid the use of fixed due dates or rental windows

appurtenant to rental models. The method is more convenient and flexible to the rental customers.

DESCRIPTION OF DRAWINGS - The drawing shows a depiction of an approach for renting audio/video items to customers over an Internet.

NOVELTY - The system has an interface to receive records representing user requests collected from individual work stations. A database contains data related to user requests. A processing device (304) creates, maintains, tracks, and forwards escalation records based on the received records. A system input/output interface is provided for handling the user requests, using a generic application on the individual workstations.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

1.a method for escalating records on internal architecture

2.a computer readable medium for storing instructions for performing a method for real time escalation of records.

USE - Used for tracking escalation in a telephone system e.g. wireless telephone, wire line telephone, facsimile machine, personal computer, and pager.

ADVANTAGE - The system provides real-time record escalation and eliminates the need for downloading or installing client software for accessing the database.

DESCRIPTION OF DRAWINGS - The drawing shows a block diagram depicting a computing device that is used to implement an escalation tracking system.

Alerting Abstract US B1

NOVELTY - The method involves programming two memory arrays with a pattern for testing charge loss. Respective bake times for the memory arrays are calculated to experience an arbitrary amount of charge loss at respective temperatures. Charge loss activation energy for a memory cell

that is represented by the arrays is calculated based on the respective bake times to lose the given amount of charge at the respective temperatures.

USE - Used for determining charge loss activation energy of a memory array in a memory device e.g. flash memory, that is utilized in a digital camera.

ADVANTAGE - The method cycles the wafers to determine the causes of failure that are undetectable without performing endurance cycling.

DESCRIPTION OF DRAWINGS - The drawing shows a flowchart illustrating a method for calculating charge loss activation energy.

Alerting Abstract US A1

NOVELTY - The system has a voice browser driver providing fragments from a speech recognition application and generating identifiers to identify the fragments. A voice browser implementation receives the fragments from the voice browser driver and downloads speech grammars, where subsequent input speech matches against the grammars with the corresponding identifiers received in a speech recognition request from the voice browser driver.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.a voice browser for multimodal dialog in a communication system
- 2.a method for enabling dialog with a voice browser for a communication system.

USE - Used for a communication system (claimed) e.g. cellular phone.

ADVANTAGE - The multimodal application can be written as a standalone program instead of a browser application by having the common voice browser driver such that the improvement is accomplished at very little cost in the communication device.

DESCRIPTION OF DRAWINGS - The drawing shows a flow chart depicting the steps of multimodal dialog.

Alerting Abstract US A1

NOVELTY - Dictionary consisting of a dendroid hierarchy of branches and nodes, is used for translating sequence of symbols into sequence of sounds. Each node represents one of the symbols, and each symbol in the node has only one sound. Each branch includes several nodes representing a string of symbols in a particular sequence.

DESCRIPTION - An INDEPENDENT CLAIM is also included for symbol and sound correlation apparatus.

USE - For correlating symbol and sound for computer, personal digital assistant (PDA), cellular telephone, wireless and cordless telephones. Also, for speech synthesis.

ADVANTAGE - Provides dictionary and corresponding process well suited to facilitate various symbols to sound activities in a way that potentially requires less memory and computational capacity, consumes less time and does not confuse the user.

DESCRIPTION OF DRAWINGS - The figure shows the detailed flow diagram explaining the symbol and sound correlation process.

Alerting Abstract US B1

NOVELTY - A specified number of items indicated by the item selection criteria are provided to the customer. In response to receiving any of the items provided to the customer, one or more items indicated by the selection criteria are provided to the customer, so that the total number of items provided to the customer does not exceed the specified number.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.a computer-readable medium carrying sequences of instructions to cause processors to perform the method; and
- 2.an apparatus for renting items to consumers.

USE - For renting items such as movies, video games or music to customers using inventory rental models.

ADVANTAGE - Customers specify what items to rent using the item selection criteria and receive the items at a future point in time, without shopping. The selection criteria is user specific and indicates a desired fulfillment sequence allowing more efficient inventory management.

DESCRIPTION OF DRAWINGS - The figure illustrates an approach for renting audio/video items to customers over the Internet using both Max out and Max turns.

Alerting Abstract EP A2

NOVELTY - Hybridization intensities of several nucleic acid probe arrays, and their corresponding control probes, are predicted (M1), the probe with the highest intensity difference over its corresponding control probe is selected.

DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- 1.predicting (M2) hybridization affinity ;
- 2.a computer program product (I) storing the probe selection program;
and
- 3.a computer program (II) storing the instructions for probe selection.

USE - (M1) is useful for selecting probes to monitor gene expression for analyzing DNA micro-arrays and to detect mutations.

ADVANTAGE - Enhances mutation detection, selecting probes and quality control of probe manufacturing process with improved efficiency.

Alerting Abstract GB A

NOVELTY - A multiplexed address/data bus transfers data blocks (63,76)
 between bus master and slave devices. The slave device includes a

transaction translation device between the bus and an indirect address device, to translate a direct address transaction (61) on the bus, to indirect address transactions (71,72) and to map the bus space address value (62) to destination address value (74).

DESCRIPTION - An INDEPENDENT CLAIM is also included for method of communicating data blocks through computer bus system.

USE - Bus system for personal computer.

ADVANTAGE - Allows unrestricted concurrent access to slave device, and enables data to be transferred directly from source to destination, without the need for all data to go through a single system master device. Hence halves the bus bandwidth used for transfer and reduces latency. Facilitates direct data transfers, without data corruption.

DESCRIPTION OF DRAWINGS - The figure shows a schematic diagram explaining direct to indirect address transaction translation.

61Direct address transaction

62Bus space address value

63,76Data blocks

71,72Indirect address transactions

74Destination address value

Alerting Abstract US A

NOVELTY - The sub-program module (102) between the personal computer (24) and commercial online information service (50), monitors the characteristics of the data transmission and the execution control flow

between the calling program and target program modules (100,104). A memory (106) collects specific attribute data, during data transmission.

DESCRIPTION - Several external devices communicate with several information services over a communication medium (16). The computer having an operating system for executing the calling program, generates function calls to target program to facilitate interface between the external device and information service. An INDEPENDENT CLAIM is included for information collection and monitoring method.

USE - For CATV, telecommunication network and internet.

ADVANTAGE - The trapping of all function calls and messages allows for the complete logging and profiling of target module operations, thereby real-time interaction between the user and the service is enhanced.

DESCRIPTION OF DRAWINGS - The figures represent block diagram of monitoring and collection system.

Alerting Abstract US A

A small-scale representation of the body of shared data display-ed to one user includes an indication of the activities of other users. A user that is not viewing the shared data at full scale can thus obtain information about the activities of other users from a small-scale representation.

The small-scale representation can indicate the type of activity, the extent or rate of changes in the shared data, the other users viewing the full-scale representation, or can show the shared data in shrunken form,

indicating the parts that have been changed. The extent or rate of changes can be indicated with a quantitative indicator such as a gauge.

ADVANTAGE - Allows collaboration between users for viewing/operating or shared data. Provides a smaller representation of the shared data.

Regional Designated States,Original: DE FR GB IT NL						
EP 381067	A3	EN				

Alerting Abstract EP A

The positioning method comprises the steps of providing an optical image of the surface of the device, obtained with an imaging device such as a video camera and a microscope, generating a synthetic CAD image from the CAD database, subjecting both images to a filtering operation (Laplacian of Gaussian convolution), bin arising (taking the sign of) the results, and correlating the two filtered and binarised images (referred to as 'processed' images) to determine relative alignment. A positioning head to which a camera is mounted is driven to the approximate location of the IC site by a positioning mechanism.

The camera image of the area near the IC site on the PCB is filtered and binarised and correlated with a processed CAD image of the region surrounding the IC site. This establishes the actual position of the camera. The positioning head is then moved by the indicated amount.

ADVANTAGE - Immune to noise, requires few adjustments.

Alerting Abstract US A

The simulation system provides a detailed, pixel level analysis of the timing while actually performing the simulation at the frame level. Input to the circuit is the form of images captured by a video camera. The processing of a frame of image data by each circuit component is simulated and the resulting frames of image data are stored until they are no longer needed by other components. The output of the simulated circuit is displayed on a monitor.

The timing of the circuit is analysed for distinct groups of components which must operate in Scaling factors are calculated for each net in the group from the incremental scaling rate of each component and the connectivity of the circuit. The scaling factors indicate the relative rate at which value pixels arrive at each net. The time at which a reference pixel arrives at each net is then to ensure that corresponding pixels arrive together at components with multiple inputs.

When the circuit is simulated, the start time and finish time for each component is determined, giving the execution time for the circuit. Output data from a group is made available to other groups when the simulated time is advanced to the finish time for the group.

ADVANTAGE - Proper timing is assured without performing simulation at pixel level.

ABSTRACT EP 1209612 A2

Methods and computer software products are provided for predicting nucleic acid hybridization affinity. In one embodiment, hybridization intensity (I) is determined using the equation: where P_i is the value of the i th parameter and S_i is a value derived from the sequence of the probe. The methods and software products of the invention may be used for enhancing mutation detection, probe selection and probe array manufacturing quality control.

ABSTRACT EP 381067 A2

A technique for position-finding on a manufactured device such as an integrated circuit ("IC") or a printed circuit board ("PCB"), relating the observed image to a description such as the CAD database that was used to create the devices. The technique contemplates providing an optical image of the surface of the device, obtained with an imaging device such as a video camera and a microscope, generating a synthetic CAD image from the CAD database, subjecting both images to a filtering operation (Laplacian of Gaussian convolution), binarizing (taking the sign of) the results, and correlating the two filtered and binarized images (referred to as "processed" images) to determine relative alignment. One application of the invention is to allow precision positioning of a positioning head relative to a workpiece such as placing an IC device (12) on a PCB (15). A positioning head (17) to which a camera (22) is mounted is driven to the approximate location of the IC site by a positioning mechanism. The positioning mechanism need not be accurate for large increments of travel, but must be capable of providing small relative displacements with high precision. The camera image of the area near the IC site on the PCB is filtered and binarized, and correlated with a processed CAD image of the region surrounding the IC site. This establishes the actual position of the camera (and therefore the positioning head). The positioning head is then moved by the indicated amount. (see image in original document)

English Abstract

A library of specialized routines (3) is described herein, some routines of which implement the malloc interface (110, 120, 130, 140). The malloc interface routines also label each allocated bloc with several items of information, including a partial call chain beginning with the caller of

malloc. Other routines use the information present in the label to track pointers and memory leaks, so as to help a programmer debug a program. In its most basic form, the method of tracking memory leaks includes the steps of: associating allocated blocks with partial call chains (510); marking allocated blocks with partial call chains (520); marking accessible allocated blocks (560); searching memory for unmarked allocated blocks (570); and, reporting partial call chains of unmarked allocated blocks (580).

French Abstract

Bibliothèque de programmes spécialisés (3), dont certains programmes mettent en oeuvre l'interface malloc (110, 120, 130, 140). Les programmes à interface malloc étiquettent également chaque bloc attribué à l'aide de plusieurs éléments d'information, y compris une chaîne d'appels partielle commençant par l'appelant de malloc. D'autres programmes utilisent l'information présente dans l'étiquette pour rechercher des pointeurs et des fuites de mémoire, de manière à aider un programmeur à mettre au point un programme. Dans sa forme la plus simple, le procédé de recherche des fuites de mémoire consiste à associer des blocs attribués à des chaînes d'appel partielles (510), à marquer les blocs attribués à l'aide de chaînes d'appel partielles (520), à marquer les blocs attribués accessibles (560), à rechercher dans la mémoire les blocs attribués non marqués (570) et à communiquer les chaînes d'appel partielles de blocs attribués non marqués (580).

English Abstract

An object code expansion program (5) inserts new instructions and data between preexisting instructions and data of an object code file (1); offsets are modified to reflect new positions of the preexisting

instructions and data. For each item of preexisting object code (instructions or data), the following steps are performed: making a new code block comprising any desired new instructions and the item, and storing it as new object code; tracking the location of the item and the new code block within the new object code; and tracking items that contain inter-item offsets. Then, each inter-item offset is updated using the new location of the item or new code block, as required. Finally, offsets in symbol tables and relocation structures are updated with the new location of the item. This expansion program is used to add instructions to object code files to monitor memory accesses of another program.

French Abstract

Un programme d'extension (5) de code resultant insere de nouvelles instructions et donnees entre des instructions et des donnees preexistantes d'un fichier (1) de code resultant; des decallages sont modifies pour refleter de nouvelles positions des instructions et des donnees preexistantes. Pour chaque article de code resultant preexistant (instructions ou donnees), on procede aux etapes suivantes: production d'un nouveau bloc de codes comprenant les eventuelles instructions nouvelles voulues et l'article, et stockage de celui-ci comme nouveau code resultant; recherche de l'emplacement de l'article et du nouveau code de bloc dans le nouveau code resultant; et recherche d'articles presentant des decallages interarticle. Ensuite, on met a jour chaque decallage interarticle a l'aide du nouvel emplacement de l'article ou du nouveau bloc de code, selon le cas. Enfin, les decallages dans les tables de symboles et les structures de translation sont mises a jour avec les nouveaux emplacements de l'article. On utilise ce programme d'extension afin d'ajouter des instructions a des fichiers de code resultant pour controler les acces en memoire d'un autre programme.

English Abstract

According to another embodiment of the invention, an approach is provided for estimating how a particular user would rate a particular item from a plurality of items. The approach is applicable to any type of items, including rental items such as movies, music and games, and the invention is not limited to any particular type of item. One or more items from the plurality of items that have ratings similar to the particular item are identified. Then, one or more other users are identified that have given ratings to the one or more items that are substantially similar to ratings given by the particular user to the one or more items. Finally, an estimation is made of how the particular user would rate the

particular item based upon ratings for the particular item given by the one or more other users.

French Abstract

Selon un autre mode de realisation de l'invention, on propose une approche permettant d'estimer la facon dont un utilisateur particulier noterait dans une pluralite de references une reference consideree prise. L'approche peut s'appliquer a tous types de references, y-compris des references de location telles que le cinema, la musique et les jeux, l'invention ne se limitant pas a un type particulier de reference. On identifie dans la pluralite de references une ou plusieurs references dont les notes sont semblables a celle de la reference consideree. On identifie ensuite un ou plusieurs utilisateurs qui ont donne aux references considerees des notes sensiblement semblables a celle des references considerees. Enfin, on estime la facon dont un utilisateur particulier noterait la reference consideree sur la base des notes attribuees a la reference consideree par les utilisateurs consideres.

Treatment: Experimental (X)

Abstract: We have fabricated high quality, dielectric Ga/sub 2/O/sub 3/ thin **films**. The **films** with thicknesses between 40 and 4000 AA were deposited by electron-beam evaporation using a single-crystal high purity Gd/sub 3/Ga/sub 5/O/sub 12/ source. Metal-insulator-semiconductor (MIS) and metal-insulator-metal structures (MIM) were fabricated in order to determine dielectric properties, which were found to depend strongly on deposition conditions such as substrate temperature and oxygen pressure. We obtained excellent dielectric properties for **films** deposited at substrate temperatures of 40 degrees C with no excess oxygen and at 125 degrees C with an oxygen partial pressure of 2×10^{-4} Torr. Specific resistivities ρ and dc breakdown fields E_{m} of up to 6×10^{13} Ohm cm and 2.1 MV/cm, respectively, were measured. Static dielectric constants between 9.93 and 10.2 were determined for these **films**. Like in other dielectrics, the current transport mechanisms are found to be bulk rather than electrode controlled. (11 Refs)

Treatment: Experimental (X)

Abstract: The authors have investigated silicon oxide formation on co-deposited Au-Si alloy **films** at low temperatures. Alloy compositions spanning the Au-Si binary phase diagram have been examined. It was found that alloys with compositions above 40 at. % Au were most efficient in promoting oxide formation. These results are compared with the Au on Si sample configuration where Si is transported through the Au before oxidizing. The possibility of using alloys to form Au lines with a self passivating oxide coating after patterning and oxidation is discussed. (7 Refs)

Conference Title: 1984 Applied Superconductivity Conference

Conference Sponsor: IEEE; Appl. Superconductivity Conference; APS

Conference Date: 10-13 Sept. 1984 Conference Location: San Diego, CA, USA

Language: English Document Type: Conference Paper (PA); Journal Paper (JP)

Treatment: Applications (A); Practical (P)

Abstract: During the past five years Sperry designed, fabricated, and tested DC SQUIDS and feedback transformer assemblies (FTA) for sensor

applications. The SQUID design included a silicon chip with deposited, all refractory, thin- **film** Josephson junctions contained in a bulk niobium toroidal cavity housing. Features include (1) minimum SQUID loop inductance provided by a cone-shaped structure extending from the chip containing the two Josephson junctions to the toroidal cavity where the input coil and concentric modulation coil are housed, and (2) a removable cap that allows easy access to the chip for repair or replacement. The design details of the junction chip, niobium housing, and FTA are presented, along with flux noise results in the 0.01 to 1000 Hz frequency range. (5 Refs)

Conference Title: 1983 International Magnetics Conference (INTERMAG)

Conference Sponsor: IEEE

Conference Date: 5-8 April 1983 Conference Location: Philadelphia, PA, USA

Language: English Document Type: Conference Paper (PA); Journal Paper (JP)

Treatment: Theoretical (T)

Abstract: This study presents numerical simulations of a single stage of a linear SQUID amplifier. The amplifier stage is fabricated in thin- **film** technology, and consists of two asymmetric SQUIDs placed in the push-pull configuration. It was found that the Q of the tank circuit formed by SQUID inductance and a parasitic stripline capacitance must be reduced to unity to avoid hysteretic operation. A load line analysis has determined the amplifier operating point and SQUID inductance which yield optimum linearity. (3 Refs)

Subfile: B

Descriptors: amplifiers; digital simulation; superconducting junction devices

LOS GATOS, Calif.--(BUSINESS WIRE)--Jan. 25, 2000--
"Movies for Two" Service from **Cinematch** (TM) Can Even Combine Ratings to Recommend the Perfect Movie for More than One Viewer
NetFlix launched its new **Cinematch** (TM) program today, a service that offers visitors movie recommendations tailored to their individual taste.

Complementing the online DVD rental store's Marquee(a) program, **Cinematch** helps visitors find the movies they will love. In addition to these personalized film recommendations for individuals, NetFlix has engineered the "Movies for Two" feature that enables **Cinematch** to combine the film ratings of two different visitors and offer a selection of films both viewers will enjoy.

Guaranteeing personal privacy, NetFlix's **Cinematch** creates a personal movie taste profile based on a visitor's ratings of a selection of previously seen films. Then, **Cinematch** guides visitors through the site's expansive selection of more than 5,200 DVD titles...

...gems -- recommending titles and content specific to that visitor.
"Our leisure time is precious. With **Cinematch** , you won't waste an

evening with a bad movie choice," said Reed Hastings, Netflix CEO. "**Cinematch** delivers personal recommendations based on your own movie taste history. If you come to Netflix...

...can be confident that you'll love your selection."

"Based on our research, systems like **Cinematch** from Netflix specifically address an important consumer need," said industry analyst Bob Alexander of Alexander...

... but what is compelling is the individual's reaction to the quality of recommendations. The **Cinematch** program should bring substantial benefits to its customers."

More About **Cinematch**

Visitors to the Netflix web site are asked to rate 20 or more movies using **Cinematch**'s five-star rating system. Then, **Cinematch** synthesizes those personal likes and dislikes to create a personal movie profile. That profile is...

...links to each recommended film title.

The more ratings a visitor performs, the smarter the **Cinematch** system becomes. Using the "Movies for Two" feature, visitors can also combine their profile with that of a fellow **Cinematch** user -- friend or spouse -- to receive film recommendations both will enjoy.

"**Cinematch** underscores Netflix's position as the Internet store that truly understands personalization," continued Hastings. "This program offers consumers the most developed personalization capabilities available. Rather than recommendations based on similars, **Cinematch** provides incredibly accurate, personalized movie recommendations that are based upon an individual's own tastes...

... and families alike: 'What movie will we all enjoy watching -- together?'"

In addition, Netflix displays **Cinematch** predictions throughout the store. Visitors may improve the quality of **Cinematch**'s recommendations by rating movies from any point on the site that features the five...

Alerting Abstract US A1

NOVELTY - The method involves calculating a risk rating based on a set of values, where each of the values is assigned to a selectable response of a criteria or question associated with a group. The group includes a set of selected countries, a selected financial product or investment and a selected customer type. A predetermined function for evaluating anti-money laundering risk is performed based the risk rating.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

1.a system to evaluate anti-money laundering risk

2.a computer-readable medium having computer-executable instructions for performing a method to evaluate anti-money laundering risk.

USE - Used for evaluating anti-money laundering risk in a financial system.

ADVANTAGE - The method effectively evaluates anti-money laundering risk for the financial system. The method allows assignment of a specific risk **score** based on a **product** mix of a **customer** who is doing business. The method facilitates to perform transaction based on monitoring of the selected customers, thus reducing need to perform transaction based monitoring.

DESCRIPTION OF DRAWINGS - The drawing shows a flow chart of an example of

a method to evaluate anti-money laundering risk.

Alerting Abstract US A1

NOVELTY - The **similarity** measures **based** on relationship distance between each pair of users who are the members of a social network, in the recommendation system, is provided. The ratings given by other users in the **recommendation** system, are **determined**, and a **weighted** average is calculated for the ratings.

DESCRIPTION - An INDEPENDENT CLAIM is also included for a collaborative filtering system for **predicting user's rating** for an **item**.

USE - For **predicting** ratings given by **users** belonging to **recommendation** system for producing list of recommended **items** e.g. for **recommendation** of music compact disks (CDs), digital versatile disks (DVDs), **movies**, wines, restaurants, **books**, etc., to new **users**, by retailer.

ADVANTAGE - Provides more accurate recommendations by incorporating social network information, avoiding new user and cold-start problems. Enables to dynamically change the social network.

DESCRIPTION OF DRAWINGS - The figure shows a flowchart explaining the user **rating prediction** method.

Alerting Abstract US A1

NOVELTY - The method involves identifying an item e.g. movie, with

ratings similar to a particular item. A **user** is identified from a set of **users** that have given ratings to a subset of the **item**. The ratings are statistically similar to **rating** given by a particular **user** to the subset of **item**. An **estimation** of how the particular **user** would **rate** the particular **item**, is generated based upon ratings for the particular **item**.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.a machine-readable medium for estimating how a particular user would rate a particular item from a set of items
- 2.an apparatus for estimating how a particular user would rate a particular item from a set of items.

USE - Used for **estimating user rating** of an **item** e.g. **movie**, music and game stored on magnetic medium, optical medium, read-only memory and non-volatile memory e.g. tape.

ADVANTAGE - The method rents the item to a customer on a continuous basis that avoids use of fixed due date or rental window appurtenant. The method rents the movie, the game and the music to a **consumer** that is more convenient and flexible to the **customer**. The method **estimates** how a **user** would **rate** the **item** that the **user** has not yet **rated**.

DESCRIPTION OF DRAWINGS - The drawing shows a block diagram that depicts a **users' rating** of an **item**.

Alerting Abstract US A1

NOVELTY - The method involves determining criteria questions and possible answers to each question for determining product sale. The weighing factor is assigned for each question and answer. The correct answer for question is **determined** through user input and a **score** is calculated for each answer based on weighing factor.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.computer program product comprising product sale determination program;
and
- 2.system for determining product sale.

USE - For determining sale of product to customer.

ADVANTAGE - The product sale can be determined easily in systematic manner.

DESCRIPTION OF DRAWINGS - The figure shows a flowchart explaining the determination process of product sale.

NOVELTY - A generation unit (16) generates item utilization frequency

data based on stored **user** ID data in association with ID data of **item** utilized by **users** . A calculation unit (17) calculates **score** reflecting **user** 's preference with respect to an **item** based on utilization frequency data. An analysis unit calculates difference between the **scores** of each **user** , to **determine users** having preference similarity with respect to an **item** .

DESCRIPTION - An INDEPENDENT CLAIM is also included for communication assistance method.

USE - Used in communication support system, for assisting communication between users having similar taste with respect to item such as content and goods information, using e-mail, electronic bulletin board and chat

ADVANTAGE - Multiple users having interest with respect to an item is determined precisely and easily within a short time without applying much effort.

DESCRIPTION OF DRAWINGS - The figure shows a block diagram of the communication support system. (Drawing includes non-English language text).

Alerting Abstract DE A1

NOVELTY - Computer **based** method for recommending a unit from **recommendations** made by **other users** . Accordingly the **recommendation** plan uses a number of **users** and a number of **items** each with a profile with at least one evaluation. By determining a subset of users from a large number of users with similar preferences it is possible to make a selection of users for provision of selection to individual users in the same sub-set.

DESCRIPTION - The invention also relates to a corresponding system, data

processing program and a computer program product.

USE - System for recommending items to users faced with a bewildering choice, e.g. for selection of books, CDs, films, magazines, etc.

ADVANTAGE - The inventive method uses recommendations made by other users with similar preferences to a user making a selection to make recommendations to a user that are likely to be suitable.

DESCRIPTION OF DRAWINGS - Figure shows a combination of user profiles and unit profiles that reflect two-dimensional coupling.

Title Terms/Index Terms/Additional Words: COMPUTER; BASED; SYSTEM; ITEM; USER; FACE; CHOICE; SELECT; BOOK; SIMILAR; PROFILE

Alerting Abstract US A1

NOVELTY - The score simulator tool is provided using which a simulated credit **score** that **predicts** real credit **score** of consumer is generated. The characteristic is altered to reflect the selected simulation when consumer selects a particular simulation option. The simulated credit score is recalculated and compared with real credit score of consumer, after which consumer is provided with a range of impacts.

USE - For explaining credit score in connection with application for credit related product and service such as loans, using Internet.

ADVANTAGE - The effect of credit score and cost for credit **related** product and services, are determined reliably **based** on various hypothetical changes in credit behavior. Thus, enables consumer to improve credit capacity, and to increase credit score.

DESCRIPTION OF DRAWINGS - The figure shows a flow diagram showing the accessing of credit bureau data through consumer credit score explanation service web site.

NOVELTY - The **rating** of several **products** are provided to the **user** based on which the predictability relation between the **users** are calculated. Several nodes are assigned and the nodes are linked based on the calculated predictability relation. A graph is searched for optimal path based on the nodes assigned. A rating associated with the user is calculated based on the predictability relation and searched path.

DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- 1.article of manufacture comprising computer readable medium storing user preference rating prediction program; and
- 2.storage medium storing user preference rating prediction program.

USE - For **rating user** preference during online purchase of **product** e.g. compact disk, **books** , video, etc.

ADVANTAGE - The **user** preference **rating** is **predicted** efficiently, thereby the **user** required **products** are purchased reliably.

DESCRIPTION OF DRAWINGS - The figure shows the flowchart explaining the user preference **rating prediction** process.

Alerting Abstract WO A1

NOVELTY - Recipe data appropriate for a user of an electronic oven can easily be provided and fetched. A recommended data decision block (508) decides a recommended menu in accordance with history information related to a use history of an electronic oven transmitted from a transmission origin and a recommendation rule stored in a recommendation rule database (507), and information indicating the recommended menu decided is transmitted from a data transmission block (506).

DESCRIPTION - Moreover, when a transmission origin transmits an instruction of transmission of recipe data about the recommended menu,

cooking information such as the recipe data corresponding to the instruction is read out from a cooking menu database (509) and transmitted from the data transmission block.

USE - For a user of an electronic oven.

DESCRIPTION OF DRAWINGS - The drawing shows a flow diagram of the system.

506 data transmission block

507 recommendation rule database

508 recommended data decision block

509 cooking menu database

Alerting Abstract EP A2

NOVELTY - **User** requests for a hardcopy of an **item** are recorded and used to form **item** ratings based on **recommendation** criteria. From the **rating** and **recommendation** criteria the processor makes **recommendations**

. The criteria used may be **item** similarities or **user** similarities stored in **user** profiles.

DESCRIPTION - INDEPENDENT CLAIMS are included for

1.method for making recommendations

2.and a computer program product for making recommendations

USE - Making recommendations.

ADVANTAGE - Provides recommendations based on user behavior.

Alerting Abstract US A1

NOVELTY - Personal profiles of two participants are created by the participants themselves. The interest with other participant is selected, rejected or expressed by a participant. A compatible match score is calculated between the participants by comparing the participant's statistics determined by choices made by one participant over the other participant.

USE - For tracking behavior of participant for matching people for marriage, dating and friendship, for matching professional services with clients, to rank potential service providers such as doctors, lawyers, realtors and investment advisors, for professional service provider to identify ideal client by **ranking** prospects, for matching potential

employers and employees, for **ranking products** and service, helping **users** to find business partners, activity partners, housemates and providing **movie** and restaurants **recommendations** and selection services. Also used in computerized dating service, Internet dating service.

ADVANTAGE - Learns and figures out the needed information based on the observation of choices and actions of participant. Hence creates a highly flexible, adaptable, and intelligent ranking system. Observation of participant behavior and corresponding adjustments to the match rankings are made in background without any burden to participant. Hence the participant simply decides who he or she is or is not interested in. Provides invisible hand to participants over time to make it easier to find a right match. Relieves participants of some burden of identifying what they are looking for, thus making it easier for the participants to fill out their personal profiles. Even if a user does not make contact with anybody, the system still figures out compatibility for that person. Also observes person's actions of non-interest in other members.

Alerting Abstract WO A2

NOVELTY - Method consists in analyzing a catalog of musical selections according to characteristics, rating musical selections by user, matching the **rating** with the characteristics to **predict** the user preference for the selections, and recommending selections to the user so that the user.

DESCRIPTION - Matching is by using a neural network so that the characteristics form a binary vector and the network learns to match the vector to the selection characteristics, or by using a map method to create a matrix of pseudo-distances between each pair of selections for comparison. The selection features printed and visual material.

USE - Method is for Internet music distribution.

ADVANTAGE - Method creates a personal radio channel with automated sales assistance.

DESCRIPTION OF DRAWINGS - The figure shows a user interface screen shot.

Alerting Abstract CA A1

NOVELTY - At the initial step (101), client request a web page with main menu presented to the user which requires login for identification .Main menu permits creating (103) of new inventory or modification of existing one . Set or subsets of icons can be provided by the server to client software for user (104) who will then create an inventory of house hold content.

DESCRIPTION - Selected icons closely representing the actual item (105) will be submitted to the server which will store the information in the inventory file or database (106). An inventory will be created by the server by looking up volume/weight of each item. Calculations by on-going cumulative basis will be done to get a quote displayed to the user by the client software.

An INDEPENDENT CLAIM is also included for a server system, creating an inventory of items including an **estimate** of total **weight** and volume for the inventory.

USE - For creating an inventory of items to be moved by a commercial moving service which includes a client/server software for communications over network.

ADVANTAGE - Standardization permits fair pricing, and similar industries to be on the same level. It is versatile due to the fact that it may include television **based** systems or various **other** consumer products and may be contained on a single computer or hand-held unit.

DESCRIPTION OF DRAWINGS - The flow diagram shows a routine of the method from start to finish.

- 101 step
- 102 creating inventory file
- 104 choose item grouping
- 105 icon representing item
- 106 database

Alerting Abstract US A1

NOVELTY - A **rating** representing the **user** reaction to the **item**, several objective archetypes (104), representing hypothetical **user** and associated **item** and **rating** representing hypothesized reaction are defined. A set of mentors (120) from the **user** group and from several objective archetypes is selected, **based on similarity** of rating of each user in group and each objective archetype. Each mentor is paired successively with selected **user** and similarity function representing overall pair **rating** agreement is computed. The selected **user rating** for not **rated items** is **predicted** from similarity functions and mentor ratings of **item**.

DESCRIPTION - An INDEPENDENT CLAIM is also included for user's reaction predicting system.

USE - For computer based marketing of items such as movies, books, music, games, food, groceries, special interest clubs, chat groups, online forums, web sites and advertising.

ADVANTAGE - Archetype **recommendation** provides ability to **predict user** 's response to new **items** and recommend new **items** to a **user** efficiently and accurately. Objective archetype **rates** all **items** satisfying best **rating** criterion.

DESCRIPTION OF DRAWINGS - The figure shows flow diagram of logical architecture of system and method for recommending items.

104 Objective archetypes
120 Mentors

Alerting Abstract WO A2

NOVELTY - An action analysis sub-system (68) receives user action behaviors correlated to content items considered by the **user**, to provide **user** profile data. A referral sub-system (62) traverses **user** profile data and **weighted** relationship data from sub-systems (54,56) for providing ordered list of content **items** relative to preset content **item**

DESCRIPTION - Weighted relation sub-systems (54,56) provides weighted relationship data representing relative similarities between characteristic attributes of preset set of content items. A referral sub-system (62)

receives **user** profile data and weighted relationship data, responsive to **user** query, to perform traversal of **user** profile data and **weighted** relationship data for providing ordered list of content **items** relative to preset content **item** . INDEPENDENT CLAIMS are also included for the following:

1. Media content recommendation providing method;
2. Content referred server system

USE - For selection of source content such as entertainment oriented media items e.g. music, books, videos.

ADVANTAGE - Enables combining content based filtering and progressively refined collaborative based filtering to deliver a set of media **item recommendations** that are consistent with a **user** 's person media content interests. Enables transmitting **recommendations** that are tailored to personalized interests of **user** . Determine scope of applicable similarities between particular and other **users** flexibly and recommends **items** within applicable scope. Enables capturing multilevel media content relationship information used to provide **recommendations** .

DESCRIPTION OF DRAWINGS - The figure shows the block diagram of personalized referral system.

Alerting Abstract WO A1

The method (fig 2) stores a **user** profile in memory for each **user** having several values representing a **rating** given to one of several **items** by the **user**, others represent additional information. Similarity factors are calculated for a user responsive to both the ratings given to the items by that user and the additional information.

Each similarity factor represents the similarity between the user and another one of the **users**. Neighbouring **users** are selected for the **user** in response to the factors. A **weight** is assigned to each of the neighbouring **users**. One of the **items** is recommended to the **user** based on the **weights** assigned to the **user**'s neighbouring **users** and the ratings given to the **item** by the **user**'s neighbouring **users**.

USE - Relates to improved method and apparatus for recommending items using automated collaborative filtering and feature guided automated collaborative filtering.

ADVANTAGE - Uses automated collaborative filtering to accurately **predict rating** that **user** will give to **item** based on **rating** given to that **item** by **users** that have tastes closely correlated with that **user**.

Alerting Abstract EP A1

The item recommendation method involves storing a profile for each of several **users** in a memory. Some of the values represent a **rating** given to **items** by a **user**. An **item** profile is stored in a memory for each of several **items**. Several similarity factors are calculated between

different **users** .

Several neighbouring **users** are selected for each **user** on the basis of the similarity factors. A **weight** is assigned to each of the neighbouring **users** . An **item** is recommended to one of the **users** on the basis of the **weights** assigned to the neighbours and the ratings they gave an **item** .

USE/ADVANTAGE - For goods and services, World Wide Web or LAN. Obtains opinions from several users on ratings. **Compares similarity** of users so as to make it likely that they have similar tastes.

Title Terms/Index Terms/Additional Words: ITEM; METHOD; ONE; USER; SELECT; SET; NEIGHBOURING; BASIS; CALCULATE; PREDICT; RATING

Alerting Abstract US A1

NOVELTY - A particular rate adoption rate adopted by identified trendsetters who are characterized as relatively early adopters of **items** that later become relatively popular within community of subscribers is measured. The particular **item** recommendations provided by the recommender system are modified based on measured adoption rate.

DESCRIPTION - An INDEPENDENT CLAIM is also included for system for providing **recommendation** of **items** to **community** of online subscribers.

USE - For influencing behavior of electronic recommender system, for monitoring particular **item** like **product**, service, content and market security of company e.g. AOL, Yahoo, Amazon, EBay, Netflix, Google and Doubleclick used by online users and subscribers, in e-commerce applications.

ADVANTAGE - Improves the performance of e-commerce website, effectively by analyzing the behavior of trendsetters.

DESCRIPTION OF DRAWINGS - The figure shows the flowchart explaining the behavior influence method of electronic recommender system.

Alerting Abstract US A1

NOVELTY - The method involves identifying adoptions of particular **item** by user, and ranking the adoptions to identify and provide trendsetter ratings to user who are early adopters of the **item**. The identifying and ranking process are repeated for another **item**, and an ordered list of trendsetters is generated based on trendsetter ratings of two **items**.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.method of identifying trendsetters within subscriber population; and
- 2.system for identifying trendsetters.

USE - For identifying trendsetters for **predicting** future **product** /service trends, evaluating advertising techniques, identifying collectible **items** such as **books**, auction articles, music recordings, services, human readable contents, computer in electronic auction, influencing search engines and recommender systems, through internet.

ADVANTAGE - Enables to test, **rate** and report the adoption **rate** and/or expected demand for a particular **item**, effectively.

DESCRIPTION OF DRAWINGS - The figure shows the flow diagram explaining the trendsetters identifying method.

Alerting Abstract WO A1

NOVELTY - The processor stores the discount rate for the service utilization charges with respect to the services provided to the user by service providers based on the user positional data. The current positional information is received based on which database is searched with respect to the service. The actual user's charge is deducted based on the discount **rate by collecting** the discount amount from service providers.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.user position based service charging method;
- 2.information terminal; and
- 3.service charge computing program.

USE - For charging management of various online services like restaurant seat reservations in hotels, bargain sales at shopping mall, **book** delivery at library/schools and other services at theme park and park using mobile telephone, personal digital assistant (PDA), personal computer, personal handy system (PHS) connected to local area network (LAN), wide area network (WAN) and internet.

ADVANTAGE - Improves sales improvement and increases the customers for a particular service area by providing the price deductions to customer through the amount collected from service providers.

DESCRIPTION OF DRAWINGS - The figure shows a schematic block diagram of service charging system.(Drawing includes non-English language text).

- 1 service center
- 1a user position database

1b charging table
 2 user
 3 terminal
 4 company

Alerting Abstract WO A2

NOVELTY - The method involves initializing a unit of a user preference profile with a preference value. The unit is associated with a content **item**. Another **item** related with the former **item** is determined for setting another preference value of the unit of the user preference profile. An equivalence of values is determined in response to a degree of similarity between the **items**.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.a record carrier comprises a computer program of a method for generating a user preference profile for use in a community based recommendation system
- 2.an apparatus for operating with content items in a community -based recommendation system
- 3.a community based recommendation system.

USE - Used for generating a user preference profile for use in a **community** based **recommendation** system (claimed).

ADVANTAGE - The method increases the flexibility and diversity for generating the user preference profile, thereby improving the **community** based **recommendations**.

DESCRIPTION OF DRAWINGS - The drawing shows an illustration of a **community** -based **recommendation** system.

- 101 Central recommendation controller
- 103 User terminal
- 105 Recommender communication unit
- 107 Recommender
- 109 User preference profile database

Alerting Abstract US A1

NOVELTY - The claim information is collected from a consumer who has potential consumer legal claims such as personal injury, **product** liability or tort claims. The **collected** claims are automatically **scored** and evaluated according to factual and medical indicators established for that specific consumer legal claim.

USE - For providing legal services on legal and commercial basis for businesses and law firms, through Internet.

ADVANTAGE - Allows the entire system to be electronically automated. A separate series of questions for each legal claim is created, based upon the specific nature of the claim involved.

DESCRIPTION OF DRAWINGS - The figure shows a flowchart describing the claim information gathering, evaluation and retention/rejection process.

Alerting Abstract WO A2

NOVELTY - Weight control software includes several modules and tools such as a journal, a weight tracker, and a meal planner, which are highly interactive and personalized. User input in one module or tool can update other modules and tools.

DESCRIPTION - An INDEPENDENT CLAIM is also included for a method of weight control.

USE - For weight watchers.

ADVANTAGE - The overall weight control process is automatic and seamless, so that the weight watcher remains motivated.

DESCRIPTION OF DRAWINGS - The figure shows the schematic diagram of the weight control software system.

100 Weight control software system

Alerting Abstract US B1

NOVELTY - The content representation of **product** is generated based on **product** content information extracted corresponding to the customers. A similarity function between pair of content attributes and compatibility attributes of the **products** are calculated based on which the closest peer group to which the **customer** belong is **determined**. A potential **recommendation** for **customer** is generated based on the peer group.

DESCRIPTION - An INDEPENDENT CLAIM is included for storage device storing **product** recommendation provision program.

USE - For providing **product** recommendation to customers for online shopping.

ADVANTAGE - Useful information for making purchases through Internet is provided to the customer by generating potential **recommendation** corresponding to the **peer** group of customer.

DESCRIPTION OF DRAWINGS - The figure shows the flowchart explaining the process of providing **product** recommendation to customers.

Title Terms/Index Terms/Additional Words: **PRODUCT** ; PROVISION; METHOD; DETERMINE; PEER; GROUP; CUSTOMER; BASED; CALCULATE; SIMILAR; FUNCTION; CONTENT; COMPATIBLE; ATTRIBUTE; GENERATE; POTENTIAL

Alerting Abstract KR A

NOVELTY - An investment **item** selection method is provided to select a business **item** among a plurality of entertainment **items** such as a **movie** or a character business via an open assessment, and to raise a fund for commercializing the selected business **item**.

DESCRIPTION - The method comprises steps of bulletining entertainment **items** over an IP server(20), enabling subscribed **members** to assess the entertainment **items** for selecting investment **items** via terminals(10), calculating online assessment **scores collected** for a certain period for **determining** investment **items**, **determining** a compensation **rate** for the bulletined entertainment **items** based on the online assessment, and offering a **determined** compensation money or stock to an **item** proposer or recommender according to a profit or business showings caused by commercializing the selected entertainment **items**. In a step of an online assessment, assessors receives assessment identification codes, and in a step of an assessment **score** calculation, an overlapping of the same identification code on the bulletined **item** is checked.

Alerting Abstract WO A2

NOVELTY - Data are collected from several data sources and are integrated to generate several data mining models. A prediction/recommendation is generated using the data mining models, in response to a received request.

DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- 1.Computer program product comprising instruction for performing enterprise web mining;
- 2.Enterprise web mining system

USE - Enterprise wide data mining through Internet for generating on-line prediction and recommendation.

ADVANTAGE - The methodology and framework adapted in data mining process, allows for generation of high value prediction and recommendation to capture and explain complex behavior and offers improved prediction accuracy.

DESCRIPTION OF DRAWINGS - The figure shows the block diagram of methodology and technical framework implemented in enterprise wide data mining system.

Detailed Description

Detailed Description

... Decision Model 500). This Confidence Measure 212 is used later in combining various parallel Attribute **Rating Estimates** and Product **Rating Estimates** .

1 5

Case-Based Estimation

In the rather more traditional style of Collaborative Filtering, we may also create Attribute Rating Estimates 213 for a subject User 201 **based** on the Attribute Rating Estimates 21 1 of **other Similar** Users 20 1, using any of the Similarity Measures in the User Similarity Table 13 created **based** on a **similarity** -weighted Set Combination (in our case, the weighted average) of the Explicit Attribute Ratings 21...

...209. Thus an Attribute

Atty Docket No.: 28749-2/PO2 Page 37 of 54 Patent

Rating Estimate 213 may be **predicted based** on Users 201 who are **Similar** by the **Product Rating Similarity** 248 (from the **User Similarity Table 13**), Attribute **Rating Similarity** 250, or **User Attribute Similarity** 252. A Confidence Measure 214 (non-interchangeable) can also be determined. This Confidence Measure...the Users 201 whose Attribute Ratings 2 1 0 were used in constructing the Attribute **Rating Estimate** 213.

Combining Attribute **Rating Estimates**

Although, at this point, it might seem helpful to combine the various types of 1...from Product Similarity from Product Ratings 232 Analogous to the traditional Collaborative Filtering method, this process **predicts** a Product **Rating Estimate** for a given **User** 201 and **Product** 222 based on the **Product** Ratings 223 of other Similar **Products** 222, as found in the **Product Similarity Table 17**. Thusly, the **Product Rating Estimate** 232 is determined as the **Product Similarity-weighted Set Combination (weighted average)** of the other **Products** ' Explicit **Product** Ratings 223 by the subject User 201. This method uses weights that are the product of the **Similarity Product Rating Similarity** 238 and the **Certainty Measure Product Rating Dimension** 239. A Confidence Measure 233 for this Estimate 232 is formed as the **weighted Confidence Measures** of the Similarities used in forming the **Estimate** 232. The **weights** of the partial Confidence Measures are the same weights as those used to weight the...

Detailed Description

Detailed Description

... similarity factors between the user and other users of this system may be calculated. The **similarity** factor for a user may be calculated by

comparing that user's profile with the profile of every **other** user of the system. This is computationally intensive, since the order of computation for calculating...

...to reduce the computational load associated with re-calculating similarity factors in embodiments that store **item** profiles by first retrieving the profiles of the newly- **rated item** and **determining** which other users have already **rated** that **item**. The similarity factors between the newly- **rating user** and the users that have already **rated** the **item** are the only similarity factors updated. Any number of methods can be used to calculate...songs on the album, and other information. In the 15 embodiment in which the **user** selects an **item** and a **rating** is **predicted** for that **item**, the system may display the actual **rating predicted**, or a label representing the **predicted rating**. For example, instead of displaying 6.8 out of a possible 7.0 for the **predicted rating**, a system may instead display "highly recommended". Embodiments in which a confidence factor is calculated...

...display "highly recommended - very sure."
In one embodiment, items are grouped in order to help **predict** ratings and increase **recommendation** certainty. For example, in the broad domain of music, recordings may be grouped according to...

...are used to improve performance because predictions and recommendations for a particular item are made **based** only on the ratings given to **other** items within the same group. Groups may be determined **based** on information entered by the users, however it is currently preferred to generate the groups...factor is calculated only for "opera" items. Any of the methods described above for calculating **similarity** factors may be used.

The neighboring users are selected **based** on the **similarity** factors (step 106). The neighboring users are weighted, and recommendations for items are arrived at...

...in the group. The similarity factor can also be used to recommend a - 16 music **item** outside of the group, if one of the users has **rated** an **item** in another group.

Alternatively, a **user** may select a group, and a **recommendation** list will be generated based on the **predicted rating** for the **user's** neighboring users in that group.

Online DVD rental specialist NetFlix launched its new movie-recommendation system, CineMatch, late last month.

"It's the only movie-recommendation system that matches [your tastes] with other people who have similar movie tastes," Reed Hastings, NetFlix CEO, said. "The old model for recommendations was, 'If I liked movie A, then I'll like movie B.' A better model is to say, 'Is there someone who has the same movie tastes as me, and, if so, what have they seen and loved that I haven't seen."

NetFlix visitors interested in using CineMatch are asked to rate at least 20 films using a fivestar scale. CineMatch will then make recommendations on other films by comparing the user's tastes with those of other CineMatch users. Since NetFlix recognizes unique users when they click on the home page, CineMatch recommendations can appear throughout the site as the registered user browses the rental selections.

Another feature of the CineMatch recommendation program is Movies for Two, which allows two CineMatch users to combine their preferences to get a movie recommendation for a title both would enjoy.

Hastings said NetFlix plans to share the information culled from CineMatch with suppliers to facilitate the development of marketing plans for new titles.

Abstract (Document Summary)

Netflix started out five years ago with a hokey and arguably harebrained business model: For a monthly fee, subscribers could rent all the DVDs they could watch, with no time limits or late fees. Netflix would then send the discs via mail, but here's the catch: Subscribers could rent only a certain number at any given time. The customers who pay \$19.95 per month could keep three; those paying \$39.95 got eight. As the DVD market boomed, so did Netflix.

Full Text (724 words)

Even if you haven't left your house in a year, you know all about the success of DVD. (Indeed, you know about it especially if you haven't left your house in a year.) The silvery disc is a big star, enriching studios, filmmakers, and the lives of Lord of the Rings fans everywhere. You may not know that the same disc has enriched a Silicon Valley dot-com, too.

Netflix started out five years ago with a hokey and arguably harebrained business model: For a monthly fee, subscribers could rent all the DVDs they could watch, with no time limits or late fees. Netflix would then send the discs via mail, but here's the catch: Subscribers could rent only a certain number at any given time. The customers who pay \$19.95 per month could keep three; those paying \$39.95 got eight. As the DVD market boomed, so did Netflix. Currently, Netflix is a publicly traded company with 742,000 subscribers. And video titans like Blockbuster and Wal-Mart have launched their own online rivals.

At face value, Netflix's business doesn't seem to require cutting-edge technical know-how. All the company needs to do is stick discs in mailers and get those mailers to customers. But keeping customers happy does in fact require some heavyweight technology. Netflix has sped up mailing times by building a network of 15 distribution centers across the country. The goal is to build enough centers so that most Netflix subscribers receive their movies within a day of shipping. The centers also give Netflix a competitive advantage over Wal-Mart and Blockbuster, each of which sends out discs from only one warehouse.

A far-flung distribution system, however, requires sophisticated software to track inventory. So Netflix has developed a system that lets the distribution centers communicate and determine the fastest way to get discs into customers' hands. For example, an order placed by a customer in Manhattan will be assigned to the distribution center in nearby Flushing, New York. If the DVD is not available, the system will poll the next-closest distribution center, in Stamford, Connecticut. If that center doesn't have it, the system contacts the next closest, and so on until the DVD is located (even if that means sending it from Netflix's main library in San Jose, California). If the disc is not found, the system will look for the customer's second choice back in Flushing. No matter where the disc is sent from, the system knows to print a return

label to the Flushing facility to minimize return-mail times.

Efficient distribution, however, is just half the challenge. Netflix CEO Reed Hastings says that keeping customers renting is equally important: "If they rent just two movies a month, they may decide it's not worth it." The average customer rents five films a month, and Hastings has put a lot of technology into maintaining that figure. By clicking on dynamic merchandising pages customers see only titles that they have not rented and that Netflix has in stock.

The company has also developed CineMatch, an Oracle database that organizes the Netflix library into clusters of similar movies and then analyzes how customers have rated them. Those who have given similar ratings to the same movies in a cluster are then matched as like-minded viewers. CineMatch looks at the clusters you've rented from in the past, determines which titles you have yet to rent, and recommends only those films that have been highly rated by matched viewers. "Over 50 percent of our traffic comes via the recommendations system," says Hastings. "It requires a lot of database work done in real time."

CineMatch runs on two Sun 420 systems and can generate thousands of predictions each second. The database of more than 200 million user ratings for more than 15,000 films is stored on a third system. "The key is the quality of the data we use," says Neil Hunt, Netflix's vice president of e-commerce. "The more data we collect about user preferences, the better the recommendations."

At peak times, Netflix has upwards of 10,000 simultaneous visitors, and each one views from 10 to 20 customized pages. All of this can run on as few as four dual-CPU Linux servers. As the DVD market continues its staggering growth, Netflix expects to attract millions. Judging from the number of competitors lining up, Netflix is not alone in its optimism.

Recommendations Power Online DVD Sales and Rentals, But Strategies Vary

Retailers employ a variety of strategies for building customer loyalty in the new realm of online DVD sales and rentals.

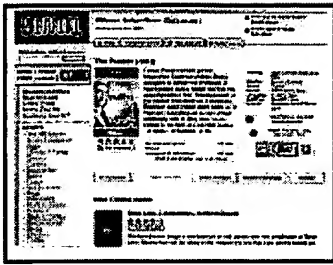

Strategists at relative newcomer Walmart.com and No. 1 online renter Netflix both say customers come to them looking for value and a broad range of titles often titles outside the mainstream - but the retailers take different approaches to service.

Netflix - which was the first to bring the concept to market and has the largest base of subscribers, with more than 1 million - puts a lot of emphasis on service and its Cinematch recommendation engine.

"There are three main ways that the engine drives rental," said Neil Hunt, VP of product development at Netflix: One, the customer asks for a recommendation; two, Netflix presents the information in a different format to appeal to a specific customer; and, three, Netflix directs the customer to movies that customers with similar tastes liked. The Cinematch engine, which is updated monthly, is a key element of the Netflix experience and one that executives credit, in part, for the site's success.

"I believe somewhere in the vicinity of 40 percent to 50 percent of the movies that people rent from the site are in some sense mediated by data coming from the recommendation system," Hunt said. "It's based on collecting ratings from members on movies that they have watched with Netflix or elsewhere. If you imagine a giant matrix where the rows are the customers and the columns are the movies, you put numbers in the cells representing each customer's rating for the movie. If I am trying to predict a blank cell for a particular customer for a particular movie, I'm going to match that against customers with similar ratings patterns."

[Enlarge 200%](#)
[Enlarge 400%](#)

[Photograph]

The site was due to get a new feature this week explaining how Netflix generates the ratings, Hunt said.

Walmart.com uses only a search engine, not a recommendation system, to generate suggestions.

"When you select a particular movie, there are two to three other movies that are identified as being similar," Sevick said, adding that the site, like its competitors, uses a proprietary algorithm. "It is subjective and is applied more at the category [genre] level than by title."

The site focuses more on price, selection and convenience than suggestions.

"Our customers are focused on 'Give me the great Wal-Mart deal online,' " said Matt Sevick, Walmart.com's DVD rental manager. "When we've talked to the Wal-Mart customer, their level of comfort with online recommendation engines is low."

As with Netflix customers, though, Walmart.com renters are more interested in finding obscure titles than brick-and-mortar renters. "Our customers are pushing more for what's beyond their local video stores," Sevick said. "The demand is generally fueled by word-of-mouth from friends who saw a film at an art house, or smaller releases, or a published review. Then there are some that are just harder to get. Imax movies have been very popular among our customer base."

Sellthrough e-tailer Amazon.com splits the difference, with a recommendation engine that offers suggestions and competitive pricing.

"You can tell from the very prominent placement that the personalization features are very important to our Web site," said Matt Round, director of personalization for Amazon's Web properties worldwide. "Home page recommendations will not be locked into any category. It's like the corner store, where you come in and the clerk recognizes you and says, 'I have a new book for you.' "

Round would not disclose the mechanics of the engine, but said it uses a customer's purchase history and some unique algorithms.

"We think we have a very strong offering in general. We offer pretty unusual and interesting titles, in part because of the breadth of our catalog," Round said. "We're not limited to talking about top sellers. We can recommend fly-fishing DVDs for specific rivers in Tennessee."

Sevick and Round would not discuss user counts, churn rates or conversion rates based on recommendations. Round did note that recommendations within the DVD store are confined to DVD, but recommendations from the home page may cross product categories.

The Pianist (2002)

Plot: Famous Polish concert pianist Wladyslaw Szpilman (Adrien Brody) struggles to survive the onslaught of Nazi tyranny during World War II in this autobiographical film. Already lauded at the time for his talents as a musician, Szpilman spent those years holed up in Warsaw, subsisting on scraps of food and barely able to stay alive. Grace comes in the form of a second chance - at music, at freedom, at life.

Abstract (Document Summary)

There are two other weaknesses in the Netflix system, one unavoidable, the other understandable. First, the company does not rent videocassettes, so its library does not include thousands of films, some of them obscure, but many of them recognized classics. Anyone hoping to binge on Barbara Stanwyck will have to do without "Ball of Fire." Preston Sturges fans will look in vain for "Easy Living." Even within the more limited universe of DVD, Netflix is not totally comprehensive. Its mainstream orientation has left an opening for GreenCine (pronounced GreenScene), an online rental company that specializes in art-house films, documentaries, Japanese anime and cult films. It does not have multiple distribution centers, but it does have "Cane Toads," an Australian documentary about, not surprisingly, cane toads. I scanned the first 20 titles listed under "film noir" and found six films not offered by Netflix.

Wal-Mart, which entered the online DVD rental business last June, undercuts Netflix with a three-movie plan priced at \$18.76 per month. Its library of about 12,000 titles passed the [Dario Argento] test with flying colors. Wal-Mart has 10 of his films, compared with five on Netflix. GreenCine, despite its alternative profile, offers only two Argento films, although it has two documentaries about the director.

Netflix, too, has its niche side. An innovative program called Netflix First makes a small number of independent films available exclusively to Netflix subscribers for a limited period. The program, which started with "Croupier," has grown to include about 20 films.

It so happens that I have a perfectly valid excuse for watching "Hercules in the Haunted World." The film, made in 1961, offered brief employment to a slab of beefcake named Reg Park, the British Steve Reeves, and at first glance it would seem to be a two-ton wheel of cheese. But somehow a genuine artist became attached to the project, a director named Mario Bava.

And who is Mario Bava? Why, the seminal influence on Dario Argento, the cult Italian horroremeister. One by one, his stylized, incredibly violent films found their way into my home in a blood-soaked festival organized by my wife, an Argento fan who cannot bring herself to watch the leisurely stabbing scenes that take up about half of every movie. We

made our way through "Inferno," "Deep Red," "Suspiria" and "Tenebre." Then it was on to Bava.

Thank you, Netflix.

Netflix, founded in 1998, is an online movie-rental company that could be described as the anti-Blockbuster. It deals only in DVD's, and customers pay a flat monthly fee of \$19.95 to rent an unlimited number of films with no late fees. The sole restriction is that subscribers may keep only three movies out at a time. (The company also offers more expensive five-film and eight-film plans.)

As each movie is returned in its self-addressed, prepaid envelope, Netflix sends out the next film on a list that the subscriber maintains online. Since the company has 23 regional distribution centers, most movies arrive the day after they are sent out. In theory a fanatic customer watching three films a day could go through several hundred DVD's each year, whittling down the per-film rental cost to a dollar or less. In practice the average user watches about six movies a month.

I became one of Netflix's nearly 1.8 million users several months ago, and I have never looked back. Overnight, life became much simpler. No longer did I have to make a mad dash to the video store, either to rent a film or to return it by the noon deadline. Late fees vanished and so did the check-out line. I cursed the endless hours spent prowling the aisles in search of misfiled films, or something -- anything -- to watch. Anything that is, except the dead-enders artfully arranged in the section labeled "staff favorites," a euphemism for "films that no one will rent, ever." Best of all, I succumbed to the pure pleasure of browsing endlessly through thousands of movies, making my selections with a click of the mouse and then seeing them slip through my mail slot, in their bright-red envelopes, just a few days later.

Netflix not only changed my routine, it also turned me into a different kind of movie watcher. Culturally, I am no longer the same person.

The flat-fee system elicits two responses: more frequent renting, and more adventurous renting. To justify the cost, you watch more films. But since four films per month averages out to the cost of four films at Blockbuster, every subsequent movie is, in a delusory sense, free, and therefore there is no risk. Why not roll the dice and order, say, "Russian Ark," a bizarre Russian film, part audioguide and part costume drama, that pulls the viewer through the Hermitage Museum in a single, extended camera shot, skipping from century to century. It's even more unwatchable than it sounds. But so what? I dropped it in the mailbox knowing that "Naked City" and "Adaptation" were on their way.

So far I have not been sent any damaged discs, and only one has gone astray after being mailed back. I filed a "missing in action" report on the Netflix Web site, and a day later, it either turned up, or Netflix wrote it off. In any case, it was no longer listed as being out.

A Few Catches

There are a few snakes in this cinematic paradise. For one thing, Netflix cannot accommodate the moviegoer who needs instant gratification. If you simply have to see "Scarface" tonight, then only the video store can help you. Cable systems offer movies on demand, but the pickings tend to be slim. My metabolism doesn't work that way. Browsing through a vast library and clicking as the mood strikes feels plenty spontaneous to me. You see it, you want it, you add it to your queue right then and there.

There are two other weaknesses in the Netflix system, one unavoidable, the other understandable. First, the company does not rent videocassettes, so its library does not include thousands of films, some of them obscure, but many of them recognized classics. Anyone hoping to binge on Barbara Stanwyck will have to do without "Ball of Fire." Preston Sturges fans will look in vain for "Easy Living." Even within the more limited universe of DVD, Netflix is not totally comprehensive. Its mainstream orientation has left an opening for GreenCine (pronounced GreenScene), an online rental company that specializes in art-house films, documentaries, Japanese anime and cult films. It does not have multiple distribution centers, but it does have "Cane Toads," an Australian documentary about, not surprisingly, cane toads. I scanned the first 20 titles listed under "film noir" and found six films not offered by Netflix.

Wal-Mart, which entered the online DVD rental business last June, undercuts Netflix with a three-movie plan priced at \$18.76 per month. Its library of about 12,000 titles passed the Dario Argento test with flying colors. Wal-Mart has 10 of his films, compared with five on Netflix. GreenCine, despite its alternative profile, offers only two Argento films, although it has two documentaries about the director.

Netflix, too, has its niche side. An innovative program called Netflix First makes a small number of independent films available exclusively to Netflix subscribers for a limited period. The program, which started with "Croupier," has grown to include about 20 films.

Netflix executives say their edge over the competition is not their library but the way the library is presented to users, who are asked to rate the films they have seen. By sifting through the ratings, about 400 million of them at present, and analyzing buying patterns, a company program called CineMatch generates rental suggestions specific to each user.

Polishing the Profile

" 'Lost in Translation' will outperform most \$300 million films for us, and that's because of our ratings and recommendations," said Ted Sarandos, the chief content officer for Netflix. " 'Monster' will be huge for us, and that's not because our subscribers are more sophisticated than the general moviegoing public, but because our merchandising system is much more specific."

My experience of CineMatch makes me an agnostic. Right now my account page tells me that, based on my rentals and ratings, I might like to rent "Aguirre, Wrath of God," "Stagecoach" or "The Vicar of Dibley." I see the logic, and it is primitive. The "Stagecoach" recommendation reflects my rental of John Ford's "Searchers," just about the only western I've seen in my adult life, unless you count "Blazing Saddles." CineMatch got lucky here. I found "The Searchers" riveting, and I put Howard Hawks's "Red River" on my queue. "Stagecoach" is indeed a viable candidate. "The Vicar of Dibley," a gentle and not very funny British comedy series, shows up because I rented two other British series, "Full Bottom" and "Thick as Thieves," both of them a lot less funny even than "The Vicar of Dibley." Three wrongs do not make a right.

In theory, as I generate more ratings, CineMatch will develop a more complex taste profile for me, but I'm doubtful. I think it will just get confused.

I don't blame it. At the moment, a domestic battle rages for control of the Netflix queue, which can be revised and reshuffled at any time. It is disputed territory. My wife likes very fat films or very slow films. It's either nonstop action, with a lot of gunplay, or painstaking, exquisitely nuanced psychological dramas, like the interminable "I Capture the Castle," a British film about an eccentric family living in Wales in the 1930's. My weakness is for pretentious foreign films. At the moment, I feel a creeping urge to rent "Andrei Rublev," a three-hour film about a medieval Russian icon painter.

Frost Warning

We each judge the other's selections harshly. I scored a major victory with "Mon Oncle" by Jacques Tati, a director I once dismissed as tedious, annoying and far too French. He is now a god in our house. But I have had my back against the wall after "L'Atalante," a film I had never seen but knew to be, by expert consensus, a towering masterpiece. Less than 10 minutes after the opening credits rolled, the atmosphere in the living room grew frosty. I lost control of the mouse for a week. At least I had the foresight to sneak off and watch "Russian Ark" on my own.

That's the fun of Netflix. Along with savage recriminations, my home now resonates with high-toned animated discussion of directors, cinematographers and camera angles. Once again I'm the moviegoer I was in college, when Bergman, Fellini and Truffaut were in full stride, and adventure was in the air, and bright-eyed cineastes could sit through a film like "El Topo" and not demand their money back. It's not available on Netflix, alas, but the Web site does propose an alternative, a compilation of "Ed Sullivan" shows featuring Topo Gigio. Close enough.

Best Practices for IT Business Leaders

We Try Harder; At Netflix the technology is the operations. But can that business model handle its rapid growth?

Abstract (Document Summary)

While price is important, customers primarily come to Netflix to take advantage of its huge library. Netflix claims to have 50,000 titles; Blockbuster claims 40,000; neighborhood rental stores generally stock about 2,000. At first blush the battle of the libraries would seem to be one that's fought with cold cash: Whoever buys the most titles wins. But without IT-business alignment, Netflix's library size might give it bragging rights, while offering customers very little.

Technology is the primary driving force" for just about everything Netflix does, says Tom Dillon, who serves as the company's COO as well as its CIO. "There's no daylight between technology and business in our company; they're basically one and the same. Whenever I look at operational challenges, I always consider how technology can meet them."

Dillon's dual role demonstrates the strength of the collaboration between IT and business at the online DVD rental company, based in Los Gatos, Calif. In fact, the connection goes further down the chain of command. The chief product officer, for instance, also has a major role in Web site development.

Dillon, who has experience in both operations and technology, started at the company as the COO and took on the CIO job when the person filling that slot left. "There are major benefits to having both roles, since we try to solve most operational challenges with technology," he says.

Given the company's rapid growth, and its strategy to ensure that it continues to grow, Netflix needs tight alignment between IT and corporate strategy. While it is still a small company, its growth since its launch in 1998 has been dramatic. From 2002 to 2004, the company's subscriber base jumped from 850,000 to 2.6 million, and it's projected to reach 4 million by the end of this year. During the same period, its net income leaped from a \$21 million loss on revenues of \$153 million in 2002 to a \$22 million gain last year on \$506 million in revenue.

Further growth will depend on several factors: maintaining its informative and user-friendly Web site, building its already competition-beating DVD library, and maintaining quick DVD turnaround times. Meanwhile, fending off competitors like Wal-Mart Stores Inc. and Blockbuster Inc., whose August 2004 entrance into the market softened Netflix's bottom line last year, requires keeping prices and costs low.

Take the challenge of fast turnarounds - how long it takes from the time consumers return a disk to the time they

receive the next one. This is an essential metric if Netflix is to be able to lure people out of their favorite bricks-and-mortar video rental store, where immediacy is the primary benefit. So Netflix tries to send out the next video within a day of receiving the last one. Part of the solution is decidedly unaligned: The company simply bought up real estate and created 35 service centers nationwide. But the geographic strategy had to be aligned with IT-developed processes to speed the flow of DVDs as they enter and leave the centers.

Because the proprietary automation process is strategic to Netflix, it's a trade secret. But in general, when a disk comes in, it is first checked to make sure the right disk is in the right sleeve, and the serial number is scanned. Then Netflix's proprietary software considers the total inventory of the title, the items on customers' wish lists of movies they want to see, and other factors. Then it either gets sent out again, placed in inventory or retired. Netflix says that it is able to check in a DVD and send out a new one within one day more than 90 percent of the time. And Dillon expects the systems to be able to scale up, although he admits that unexpected bottlenecks have plagued the company. "Bottlenecks are not something we can predict. We have to deal with them as they come up on a case-by-case basis," he says.

As to pricing and library size, such issues can be attacked with brute force, meeting the first challenge by cutting profits to the bone and the second by buying up DVDs willy-nilly. But Netflix augments those strategies with technological finesse - allowing the company to withstand a price war with Blockbuster, which has much greater resources for such a battle, and forcing Wal-Mart to give up its online rental efforts and turn over its insignificant subscriber list to Netflix in May.

When Blockbuster entered the market last year, it aggressively priced its most popular subscription \$7 below Netflix's, forcing Netflix to drop from \$21.99 per month to \$17.99. Blockbuster's size may allow it to withstand large losses for a time, but Netflix had to be more cautious. To sustain lower prices, Netflix would have to reduce costs. And that's where technology comes in. "Our theory is that by applying technology, everything can be made more efficient," says Dillon.

Netflix, for example, is flooded with 100,000 new disks a day. When the company first started up, the receiving clerk would pick up a box from the pallet, find the paperwork, and match the box with the purchase order. Now the receiver just slaps a label and bar code on the box, and the system automatically matches the code with the purchase order. Through such tactics, Dillon says he has been able to reduce labor costs related to receiving by 50 percent - and he's aiming for 75 percent.

The price war was a factor in Netflix's smaller projected income this year of less than \$11.9 million, but the company is doing better than Blockbuster, which showed a net loss of \$57.2 million for the second quarter of 2005. In fact, Blockbuster recently hoisted the white flag, raising its subscription price in August to parity with Netflix.

While price is important, customers primarily come to Netflix to take advantage of its huge library. Netflix claims to have 50,000 titles; Blockbuster claims 40,000; neighborhood rental stores generally stock about 2,000. At first blush the battle of the libraries would seem to be one that's fought with cold cash: Whoever buys the most titles wins. But without IT-business alignment, Netflix's library size might give it bragging rights, while offering customers very little. "It doesn't matter very much to customers how many movies we have if most people only rent the top 100," says Neil Hunt, chief product officer at Netflix.

So the Web site is being continually tweaked to "generate traffic to more movies that otherwise may have languished in our library," says Hunt. Besides displaying Amazon-like recommendations when subscribers enter the site, Netflix recently introduced a wizard that lets users rate movies and then receive recommendations based on those ratings. Since its introduction, the average queue length for new customers has grown from 4 to 8 titles, Hunt says, while the number of new releases rented by members has dropped to around 40 percent.

So far, Netflix is the clear winner in a market of two. Like Amazon.com Inc., Netflix enjoys a strong online reputation and a very technology-friendly culture. As Wal-Mart and Blockbuster learned, name recognition offline doesn't necessarily translate into online success. And the technology needed to support stores is far different from that needed online. "Netflix is far more established in people's minds with this service, and it knows how to use technology to fend off much of what the big offline names are throwing at it," says Dennis McAlpine, a securities analyst with McAlpine & Associates.

Still, Netflix has a hard road to travel. McAlpine points out that Blockbuster has done a poor job of combining its on- and offline operations so far. But if it can figure out how to offer in-store and online rentals for the same price - a service which would probably require new technology - it could become a formidable competitor. An even more serious attack

may come from Amazon, which is rumored to be considering a foray into this market. "Amazon has a lot of click-throughs. If they can divert some of them to an online DVD rental business, Netflix will have a fight on its hands," McAlpine says.

And no one knows what role new technologies, primarily downloadable movies, will play. Netflix is trying to stay ahead of the game. This year, it invested up to 2 percent of revenue developing a video-on-demand service that will offer movies downloaded onto a personal video recorder sold by TiVo Inc. and others. Netflix is expected to test the program with a limited number of titles and subscribers next year.

In the past year, Netflix was able to fight two retail dragons - Wal-Mart and Blockbuster - slaying one and wounding the other. But more dragons are in the offing. What will be required to maintain its impressive pace? More of the same, says Dillon. Current applications and processes should be able to handle the business at least until the company reaches 15 million to 20 million subscribers, although it will need some tinkering. "I think we're okay as long as we continue to make gradual improvements to our systems for the next five years. That's about as far in the distance as we can look right now."

Abstract (Document Summary)

In fact, thanks to a surge of Oscar-related interest, "Crash," which barely cracked the top 50 grossing movies of 2005, is poised to become Netflix's most rented movie of all time. "Hotel Rwanda," which made only \$23 million in theaters, is one of Netflix's top five all-time rentals. The documentary "Born Into Brothels" has racked up 500,000 rentals, while "Oldboy," a cult Korean action thriller, has done nearly 50 percent of its rental business through Netflix.

MOVIES

Philip Dell' Isola is a fan of all things Irish, especially any movie with Colm Meaney in it. Even so, he was only vaguely familiar with "Intermission," an obscure Irish film that featured Meaney and a host of other great Irish actors until he noticed that a friend had recommended it on Netflix, America's favorite online movie rental site.

"When I saw it, I loved it," recalls Dell' Isola, a 37-year-old marketing executive for Boating magazine who's been a Netflix subscriber for two years. "In fact, it's so good I can't imagine why it didn't do better at the box office. I guess I'm one of the reasons because I didn't go see it, but I probably didn't even know it was playing in a theater here. If it wasn't for Netflix I would've never seen it."

"Intermission" was easy to miss. It played in theaters only for a few weeks in the spring of 2004. It never played on more than 69 screens, which means that if you live outside of America's biggest cities, you couldn't see it in a theater at all. But at Netflix, if a movie has passionate fans, even a tiny indie film can compete with studio behemoths backed by \$40-million marketing campaigns.

'Crash' a popular choice

In fact, thanks to a surge of Oscar-related interest, "Crash," which barely cracked the top 50 grossing movies of 2005, is poised to become Netflix's most rented movie of all time. "Hotel Rwanda," which made only \$23 million in theaters, is one of Netflix's top five all-time rentals. The documentary "Born Into Brothels" has racked up 500,000 rentals, while "Oldboy," a cult Korean action thriller, has done nearly 50 percent of its rental business through Netflix.

"What we do is 'slivercasting,'" says Ted Sarandos, Netflix's chief content officer. "In an era where there are so many

homogenized films trying to reach every quadrant of the audience, we can help a great little movie find as big an audience as a big mediocre one. In most video stores, I'd be lucky to find one copy of the Werner Herzog documentary "Grizzly Man," but on our site, it finds its way, in a very democratic manner, to the front of the new releases pool. If TiVo has helped people free themselves from a linear TV schedule, then we're helping free people from the top 100 commercial movie model."

Launched in 1998 by Reed Hastings, a one-time Peace Corps math teacher who made his money in Silicon Valley, Netflix has 4.2 million subscribers with access to 55,000 DVD titles. For a \$17.99 monthly subscription fee, members can rent three DVDs at a time, with no limits and no late fees. (The Bay area-based company has nine subscription plans in all, including those for more casual or serious film fans.) After members watch a movie, they send it back in a pre-addressed, postage-paid envelope. The company ships an eye-popping 1.4 million DVDs each day, generally by one-day delivery. The temptation of all these great movies bouncing around America has proved too great for some postal carriers -- inspectors have nabbed mail carriers in a number of cities who've stolen DVDs from Netflix envelopes on their routes.

Although most of the media coverage about Netflix has treated it as a Wall Street success story, its real effect is cultural. It has created a business model, very much like XM Satellite Radio, that provides an alternative to the deluge of dumbed-down entertainment that has swamped our pop culture. In terrestrial radio, a station playing a gifted but little-known singer such as Neko Case can't compete with a station spotlighting big sellers such as Mariah Carey -- to the highest-rated station go the advertising spoils. But on XM, with its 150 channels of music, bluegrass, Latin jazz or hard-core punk has just as much sway as top 40.

Netflix offers a similar model. Because it relies on subscriber ratings and recommendations, and can offer an almost limitless array of product, it creates a level playing field, allowing a tiny indie film to compete with a multiplex monster. It's a great example of what Wired magazine's Chris Anderson calls the Long Tail. Put simply, our culture is increasingly shifting away from a focus on a relatively small number of blockbusters at the head of the demand curve and toward a huge number of niches in the tail. If you go to a movie theater or a Blockbuster, the vast majority of business comes from a few dozen films. But at Netflix you can see the Long Tail in action -- its subscribers rent more than 95 percent of its 55,000 titles every quarter.

Netflix subscribers keep a "queue" of movies they want to rent. The beauty of this system, as Sarandos describes it, is that it "archives the impulse." The bane of movie marketers has been the gap between getting a customer's attention and getting them to act on it. With a queue, subscribers can log in a movie they've just heard good buzz about, even if it isn't out on DVD yet.

Fans provide ratings

It's the ratings that make Netflix such a uniquely participatory environment. In the studio-dominated world of first-run movies, marketing is all powerful. At Netflix, the power is in a trust network of movie fans who have provided 1 billion movie ratings. The company processes these ratings using a complex form of algorithm-style data crunching that enables it to create a personalized home page for each subscriber.

In fact, visiting Netflix isn't so different from scrolling around MySpace.com, the popular youth culture Web site. Each site is an oasis of connectivity, a sprawling community of people eager to share their enthusiasms. The common denominator is personalization. Each site harbors a fierce resistance to mass marketing -- everyone wants to discover their own bands or their own movies. On MySpace you can read people's online journals and view their pictures and friends' lists. At Netflix, one of the most popular features is a friends section, where anyone can share movie recommendations or view one another's film queues.

With such a specific database, Netflix has become a partner with studio specialty divisions in various promotional deals. When Sony Pictures Classics was opening "Kung Fu Hustle" last year, Netflix sent out e-mail blasts to subscribers who were fans of similar martial-arts films who lived within five miles of the theaters playing "Hustle."

"It was incredibly effective," says Sony Classics co-chief Tom Bernard. "Even if people don't see the movie in a theater, they put it in their queue to rent. We did \$30 million worth of video business on 'Hustle,' and while you can't totally quantify it, we figure that a really big chunk of that came from Netflix."

According to Sarandos, 75 percent of the movies that subscribers put in their queues are inspired by some facet of the Netflix ratings system.

Netflix isn't perfect. Even though it has been the No. 1 rated Web site for consumer satisfaction for two years running, it recently got a black eye for a practice known as "throttling" after a legal fight revealed that the company had in some instances delayed shipments to heavy users while shipping films more quickly to subscribers who rented fewer films. Like XM, the company will need continued growth to keep Wall Street analysts happy. Netflix projects that it will have at least 5.9 million members by the year's end, but it will face increased competition, especially when movie fans begin downloading films directly to their home-entertainment systems.

But in an era when the dominance of studio marketing had threatened to marginalize quality films, Netflix has become a key element in the democratization of the medium. "It's like MySpace without the dirty words," says ThinkFilm's theatrical chief Mark Urman. "Before they were around, my company could get great reviews for a film, but it couldn't open on 3,000 screens or be on the shelf at every Blockbuster. With Netflix, not only is our movie completely available, but the consumer gets this wonderful curatorial assistance. They're told, 'If you like that, you're really going to like this.' That builds the best kind of word of mouth, from people you trust."

As for Dell'Isola, he says he's not only watching more movies than he did before, but also a wider range of films. He just added a film by the late master Indian filmmaker Satyajit Ray to his queue after it got great ratings from fellow subscribers. Call it cinema consciousness-raising. As Dell'Isola put it: "I wouldn't doubt that five years from now we'll read a story about some hip new film director who'll say, 'My film school was Netflix.'"
